

## Rules

- **Main branch** - the main branch is stable – someone could clone it and start to use the app
- **New branches**
  - Create new branch for new features – **one feature on one branch**
  - **Branch name** from the feature name, summary or similar text
  - Keep the **branch up to date** with Main branch
  - Once the feature is implemented, **create pull request**
    - Review your own the pull requests first – to detect small errors and typos
    - Clear title and detailed description
- **Reviewer**
  - will respond for pull requests

## Directory structure

- **src** Folder - The source code folder!
- **tests** Folder - Unit tests, integration tests... go here.
- **docs** Folder - The documentation folder
- **res** Folder - For all static resources in your project. For example, images.
- **.gitignore** - List of blobs for git to ignore. Affects commands like git add and git clean. You may use gitignore.io to generate a clean and useful gitignore file.
- **README** File - README or README.txt or README.md etc. is a file that answer the What, Why and How of the project. GitHub will recognize and automatically surface the README to repository visitors.
- **LICENSE** File - LICENSE or LICENSE.txt or LICENSE.md etc. is a file that explains the legal licensing, such as any rights, any restrictions, any regulations, etc.
